

MDMI Message Transformations Using Swagger

In your web browser, go to the MDMI Swagger page at:

<http://ec2-3-16-40-203.us-east-2.compute.amazonaws.com:8080/swagger-ui/index.html?url=/v3/api-docs&validatorUrl=#/mdmi-engine/transformation>

Start by opening the **GET /mdmi/transformation** section at the top of the page. Click **Try it out**, then **Execute**.

The **Try it out** button becomes **Cancel** and the results of the execution are displayed. Note the **Server response** block. It contains the names of transformation maps that are active in this implementation.

Specifically, the “name” elements in the JSON string represent message types. Select the one that represents your message type and the one to which you want your message transformed.

Activate the **POST /mdmi/transformation** section by clicking the **Try it out** button. Enter the message type names in the **source** and **target** entry fields.

POST /mdmi/transformation

Parameters

Name	Description
source * required string (query)	HL7V2.ADTA01CONTENT
target * required string (query)	FHIR.FHIRMaster

In the **message** block click the **Browse** button to upload your source message. Then click **Execute**. The transformed message is displayed in the **Responses** block.
